                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (Calcium-activated
                                                                                                                                                                                                                                                                                           FUNCTION: Calcium regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.

CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Arg-|-Xaa with Leu or Val as the P2 residue.

COPACTOR: Binds 3 calcium ions.

ENZYME REGULATION: Activated by 200-1000 micromolar concentratic of calcium and inhibited by calpastatin.

                                                                                                                                              (regulatory) subunit.
SUBCELULIAR LOCATION: Cytoplasmic; Translocates
membrane upon Ca++ binding.
SIMILARITY: Contains 5 EF-hand calcium-binding
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2.
                                                                                                                                                                                                                                                                              SUBUNIT: Heterodimer of a large (catalytic) and

SUBCELLULAR LOCATION: Cytoplasmic; Translocates
membrane upon Ca++ binding.
SIMILARITY: Contains 5 EF-hand calcium-binding
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction (By similarity). CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Arg-|-Xaa with Leu or Val as the P2 residue.

COFACTOR: Binds 3 calcium ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SUBUNIT: Heterodimer of a large (catalytic) and

TISSUE SPECIFICITY: Ubiquitously expressed.

PTM: THE N-TERMINUS IS BLOCKED.

SIMILARITY: Contains 5 EF-hand calcium-binding SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2.

CAUTION: THIS PROTEIN WAS PREVIOUSLY THOUGHT TO HAS SINCE BEEN FOUND TO BE AN INTERMEDIATE FORN

SUBCELLULAR LOCATION: Cytoplasmic; Translocates membrane upon Ca++ binding (By similarity).
SIMILARITY: Contains 5 EF-hand calcium-binding SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.

CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Arg-|-Xaa with Leu or Val as the P2 residue.

COFACTOR: Binds 3 calcium ions (By similarity).

ENZYME REGULATION: Activated by micromolar concentrations of

Biochem. 101:889-895(1987).

- FUNCTION: Calcium regulated non-lysosomal thiol-protease catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.

- CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met Arg-|-Xaa with Leu or Val as the P2 residue.

-- COFACTOR: Binds 3 calcium ions (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EDJUENCE FROM N.A.

"Clinical, pathological, and genetic features of limb-girdle m dystrophy type 2A with new calpain 3 gene mutations in seven p from three Japanese families.";
Muscle Nerve 21:1493-1501(1998).
-!- FUNCTION: Calcium-regulated non-lysosomal thiol-protease.
-!- CATALYTIC ACTIVITY: Preferential Cleavage: Tyr-|-Xaa with Leu or Val as the P2 residue.
-!- Arg-|-Xaa with Leu or Val as the P2 residue.
-!- ENZYME REGULATION: Activated by micromolar concentrations calcium and inhibited by calpastatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Haeffner K., Speer A., Huebner C., Voit T., Oexle K.;

                                                                                                                                        TISSUE SPECIFICITY: Skeletal muscle.

DISEASE: Defects in CAPN3 are the cause of limb-girdle muscular dystrophy type 2A (LGMD2A) [MIM:253600]. LGMD2A is both autosomal dominantly and recessively transmitted. It is characterized by progressive symmetrical atrophy and weakness of the proximal limb muscles and elevated serum creatine kinase. The symptoms usually begin during the first two decades of life, and the disease gradually worsens, often resulting in loss of walking ability 10 or 20 years after onset.

SIMILARITY: Contains 4 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                        (regulatory) subunit.

Patent No. US20020077276A1

GENERAL INFORMATION:
APPLICANT: Fredeking, Terry M.
APPLICANT: Fredeking, Terry M.
APPLICANT: Ignatyev, George M.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATING HEMORRHAGIC VIRUS
TITLE OF INVENTION: INFECTIONS AND OTHER DISORDERS
FILE REFERENCE: 24881-301C
CURRENT APPLICATION NUMBER: US/09/840,707A
CURRENT APPLICATION NUMBER: US/99/840,707A
CURRENT FILING DATE: 2000-04-23
PRIOR APPLICATION NUMBER: 09/562,979
PRIOR APPLICATION NUMBER: 60/198,210
PRIOR APPLICATION NUMBER: 60/198,210
PRIOR FILING DATE: 1999-04-27
NUMBER OF SEQ ID NOS: 26
